G-Cloud  
Supplier

### Global Content Delivery Network (CDN)

Improve latency and performance with location-based access to your website using Cloudflare's data centres around the world.

### Web Application Firewall (WAF)

Protects your business from common vulnerabilities like SQL injection attacks, cross-site scripting, and cross-site forgery requests with no changes to existing infrastructure.

### IP Masking

Domain records are updated to go through Cloudflares network first, meaning that domain name system searches will return a Cloudflare Network result. This process of masking server IP address, helps protect against malicious server attacks.

### Limited DDoS Mitigation

One of the largest DDoS protection networks in the world, offering protection based on Anycast technology, which has successfully mitigated attacks bigger than 400Gbps.

### Zero-Day Attacks

Patches are automatically deployed to protect against zero-day attacks, vulnerabilities and new threats to websites.

### Faster Page Load Speeds

Automatically adjusts the cache header instructions so browsers will correctly cache resources of a website to minimize the need for new requests. Also, removes unnecessary characters from HTML, CSS, and JavaScript, saving 20% of a file's size and fully supports dynamic pages.

### PCI-DSS 6.6 Compliant

The Cloudflare WAF can assist in meeting PCI DSS 2.0 and 3.0 Requirement 6.6.
